Micro Frontends

An architectural style where independently deliverable frontend applications are composed into a greater whole

Our Objectives

Our Objectives Quicker path to production

Our Objectives Quicker path to production Preserve autonomy

Plenty of ways to implement micro frontends

The one right way to do microfrontends - two opinions youtube.com/watch?v=Wly6KseqABE

Let's talk about our implementation

What is module federation?

New feature in Webpack 5

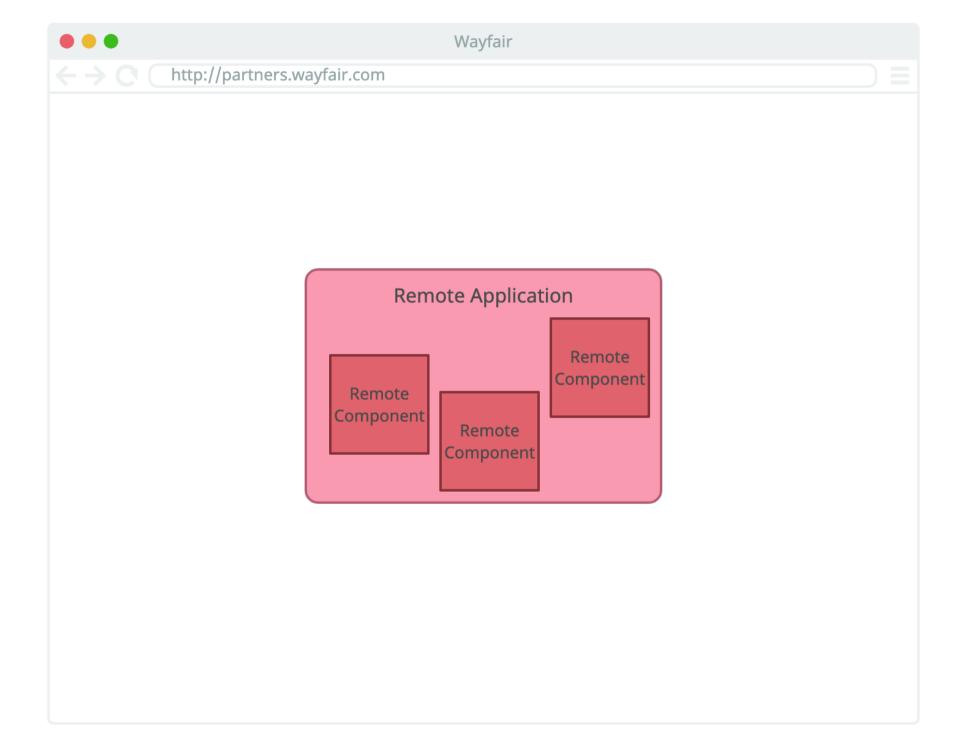

webpack.js.org/concepts/module-federation/

Load modules remotely at runtime

Why is that relevant?

Low friction integration between independent applications

Making an Application Remote

```
new ModuleFederationPlugin({
     name: 'remote',
     filename: 'remoteEntry.js',
 4
     exposes: {
 5
        ./Welcome': './src/Welcome',
 6
     shared: [
 8
         react: { requiredVersion: deps.react, singleton: true },
          'react-dom': { requiredVersion: deps['react-dom'], singleton: true },
10
          '@applications-instead-of-libraries/shared-library': {
11
12
            import: '@applications-instead-of-libraries/shared-library',
13
           requiredVersion: require('../shared-library/package.json').version,
14
15
          '@material-ui/core': {
           requiredVersion: deps['@material-ui/core'],
16
           singleton: true,
17
18
         },
19
20
```

```
new ModuleFederationPlugin({
  name: 'remote',
  exposes: {
     './Welcome': './src/Welcome',
  shared: [
      react: { requiredVersion: deps.react, singleton: true },
       'react-dom': { requiredVersion: deps['react-dom'], singleton: true },
       '@applications-instead-of-libraries/shared-library': {
         import: '@applications-instead-of-libraries/shared-library',
         requiredVersion: require('../shared-library/package.json').version,
         requiredVersion: deps['@material-ui/core'],
         singleton: true,
```

```
new ModuleFederationPlugin({
    name: 'remote',
4
    exposes: {
5
       ./Welcome': './src/Welcome',
6
    shared: [
        react: { requiredVersion: deps.react, singleton: true },
        'react-dom': { requiredVersion: deps['react-dom'], singleton: true },
        '@applications-instead-of-libraries/shared-library': {
          import: '@applications-instead-of-libraries/shared-library',
          requiredVersion: require('../shared-library/package.json').version,
          requiredVersion: deps['@material-ui/core'],
          singleton: true,
```

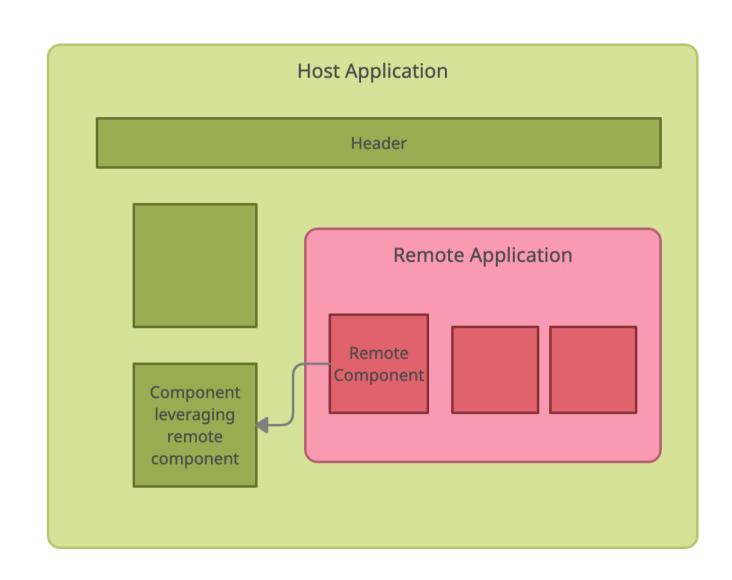

That's it?

Consuming a Remote Application

http://partners.wayfair.com

```
new ModuleFederationPlugin({
     name: 'host',
     remotes: {
       remote: 'remote@http://localhost:3002/remoteEntry.js',
 5
     },
     shared: [
 6
         react: { requiredVersion: deps.react, singleton: true },
 8
          'react-dom': { requiredVersion: deps['react-dom'], singleton: true },
          '@applications-instead-of-libraries/shared-library': {
10
11
            import: '@applications-instead-of-libraries/shared-library',
12
           requiredVersion: require('../shared-library/package.json').version,
13
14
          '@material-ui/core': {
           requiredVersion: deps['@material-ui/core'],
15
16
           singleton: true,
17
          },
18
20 })
```

```
new ModuleFederationPlugin({
    remotes: {
      remote: 'remote@http://localhost:3002/remoteEntry.js',
5
    },
    shared: [
        react: { requiredVersion: deps.react, singleton: true },
        'react-dom': { requiredVersion: deps['react-dom'], singleton: true },
        '@applications-instead-of-libraries/shared-library': {
          import: '@applications-instead-of-libraries/shared-library',
          requiredVersion: require('../shared-library/package.json').version,
        '@material-ui/core': {
          requiredVersion: deps['@material-ui/core'],
          singleton: true,
```

```
const OtherComponent = React.lazy(() => import('remote/OtherComponent'));
```

```
export default class LazyModule extends React.Component {
     constructor(props) {
       super(props)
       this.state = { error: null }
 5
 6
     render() {
       return (
 8
         <React.Suspense fallback={this.props.delayed ?? null}>
           <OtherComponent />
10
11
         </React.Suspense>
12
13
```

```
const OtherComponent = React.lazy(() => import('remote/OtherComponent'));
```

```
export default class LazyModule extends React.Component {
     constructor(props) {
       super(props)
       this.state = { error: null }
     render() {
         <React.Suspense fallback={this.props.delayed ?? null}>
 9
           <OtherComponent />
10
         </React.Suspense>
11
```

A problem Dynamic loading

```
{
  remotes: {
   remote: 'remote@http://localhost:3002/remoteEntry.js',
  }
}
```

More flexible loading

```
const RemoteComponent = ({component, error, delayed, environment, ...props}) => {
  const RemoteComponentLoader = useMemo(
    () => loadRemoteComponent({ component, environment }),
    [component, environment]
  const RemoteObject = useMemo(
    () => React.lazy(RemoteComponentLoader),
    [RemoteComponentLoader]
  return (
    <LazyModule error={error} delayed={delayed}>
      <RemoteObject {...props} />
    </LazyModule>
export default RemoteComponent
```

Shared Dependencies

You don't want to download React multiple times

You don't want strong coupling, either

```
shared: [
         react: { requiredVersion: deps.react, singleton: true },
          'react-dom': { requiredVersion: deps['react-dom'], singleton: true },
 5
          '@applications-instead-of-libraries/shared-library': {
 6
            import: '@applications-instead-of-libraries/shared-library',
           requiredVersion: require('../shared-library/package.json').version,
 8
 9
          '@material-ui/core': {
10
11
           requiredVersion: deps['@material-ui/core'],
12
           singleton: true,
13
          },
14
15
      1,
16 }
```

```
shared: [
   react: { requiredVersion: deps.react, singleton: true },
    'react-dom': { requiredVersion: deps['react-dom'], singleton: true },
    '@applications-instead-of-libraries/shared-library': {
      import: '@applications-instead-of-libraries/shared-library',
      requiredVersion: require('../shared-library/package.json').version,
    '@material-ui/core': {
      requiredVersion: deps['@material-ui/core'],
      singleton: true,
```

Beyond Single Components

Keeping internal state private

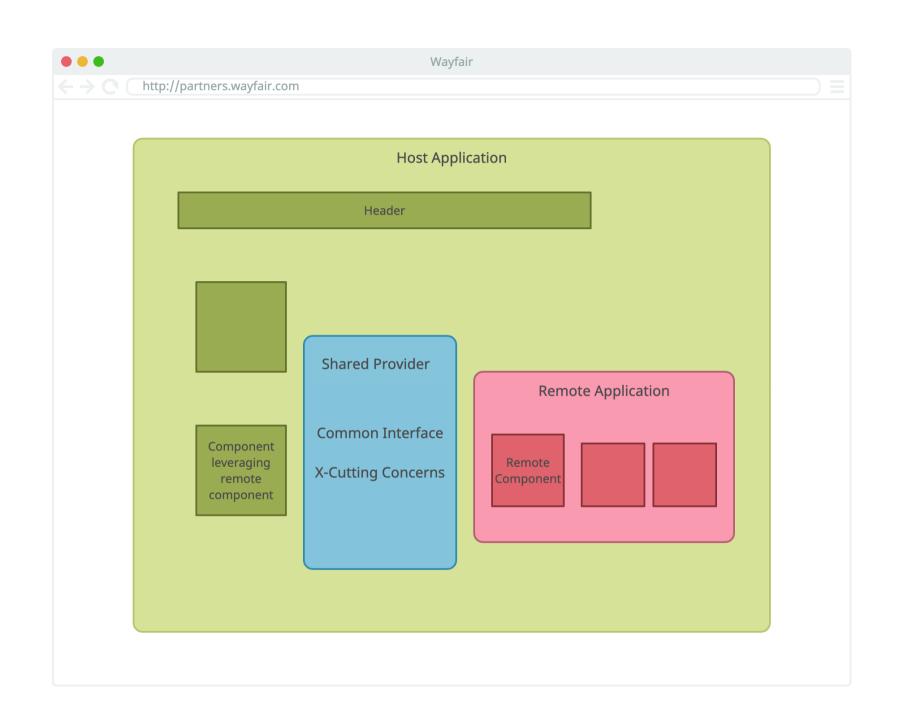

```
1 const Context = createContext('')
   export const useContext = () => React.useContext(Context)
   const WelcomeFrame = () => {
     return (
       <Context.Provider value="[private]">
 6
         <Card variant="outlined">
           <CardHeader title="WelcomeFrame"></CardHeader>
           <CardContent>
10
             <Welcome />
           </CardContent>
11
12
         </Card>
       </Context.Provider>
13
14
15 }
```

```
const Context = createContext('')
   export const useContext = () => React.useContext(Context)
   const WelcomeFrame = () => {
         <Card variant="outlined">
           <CardHeader title="WelcomeFrame"></CardHeader>
12
```

```
1 const Context = createContext('')
 2 export const useContext = () => React.useContext(Context)
   const WelcomeFrame = () => {
       <Context.Provider value="[private]">
 6
         <Card variant="outlined">
           <CardHeader title="WelcomeFrame"></CardHeader>
12
```

Interactions between host and remote applications

```
const HostApplication = () => {
      return (
        <LanguageProvider value="de-DE">
          < Box p={1}>
            <RemoteComponent</pre>
              component="WelcomeFrame"
 6
              delayed={<>Loading...</>}
            />
 8
          </Box>
 9
        </LanguageProvider>
10
11
12 }
```

X-Cutting concerns Logging Monitoring i18n

Production Ready

• • •

To make error is human. To propagate error to all server in automatic way is #devops.

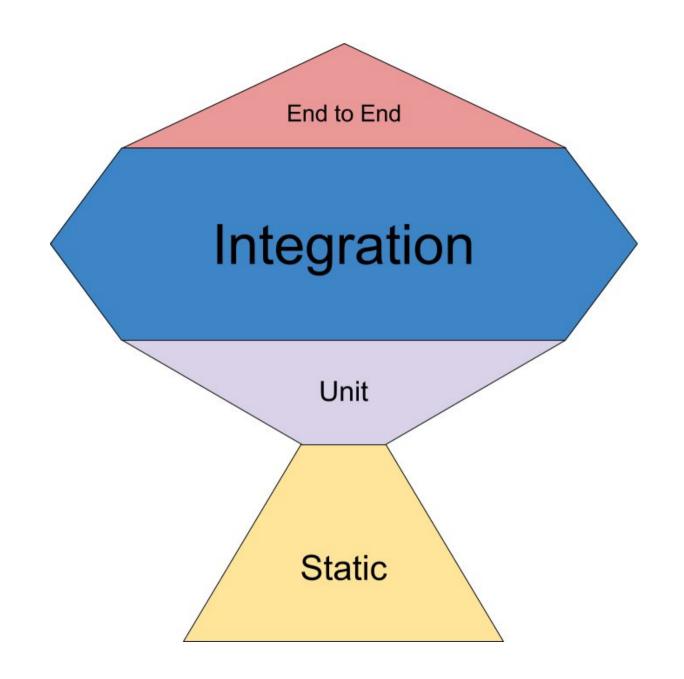

8:55 PM · Feb 26, 2011 · Mobile Web

Error Handling

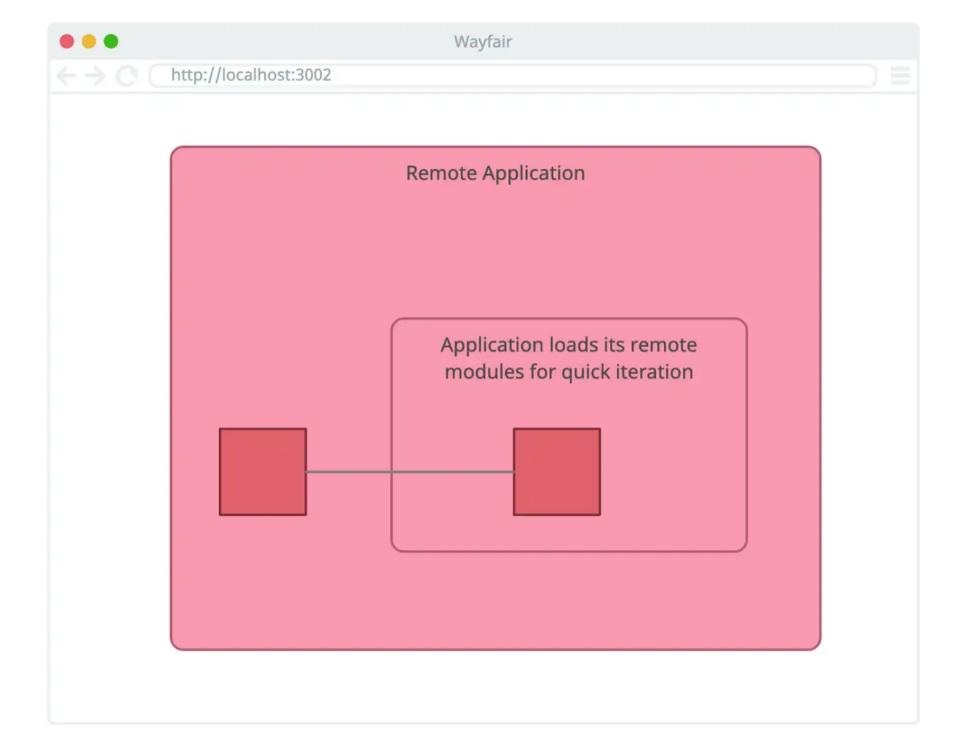

```
export default class LazyModule extends React.Component {
  static getDerivedStateFromError(error) {
    return { error }
  constructor(props) {
    super(props)
    this.state = { error: null }
  componentDidCatch(_error, errorInfo) {
    // eslint-disable-next-line no-console
    console.error('LazyModule failed while loading remote module', errorInfo)
    if (this.props.logger) {
      this.props.logger.error({
        message: 'LazyModule failed while loading remote module',
        data: errorInfo,
```

```
export default class LazyModule extends React.Component {
  render() {
    if (this.state.error !== null) {
      const errorFallback = this.props.error
      if (React.isValidElement(errorFallback)) {
        return errorFallback
      } else if (typeof errorFallback === 'function') {
        return errorFallback({ error: this.state.error })
      } else {
        return null
    return (
      <React.Suspense fallback={this.props.delayed ?? null}>
        {this.props.children}
      </React.Suspense>
```

Testing

Testing remote components

```
context('Integrated Application', () => {
  beforeEach(() => {})

it('shows the integrated remote component', () => {
   cy.visit('http://localhost:3001')

  cy.contains('Host Application').should('exist')
  cy.contains('The selected locale is de-DE').should('exist')
  })
})
```

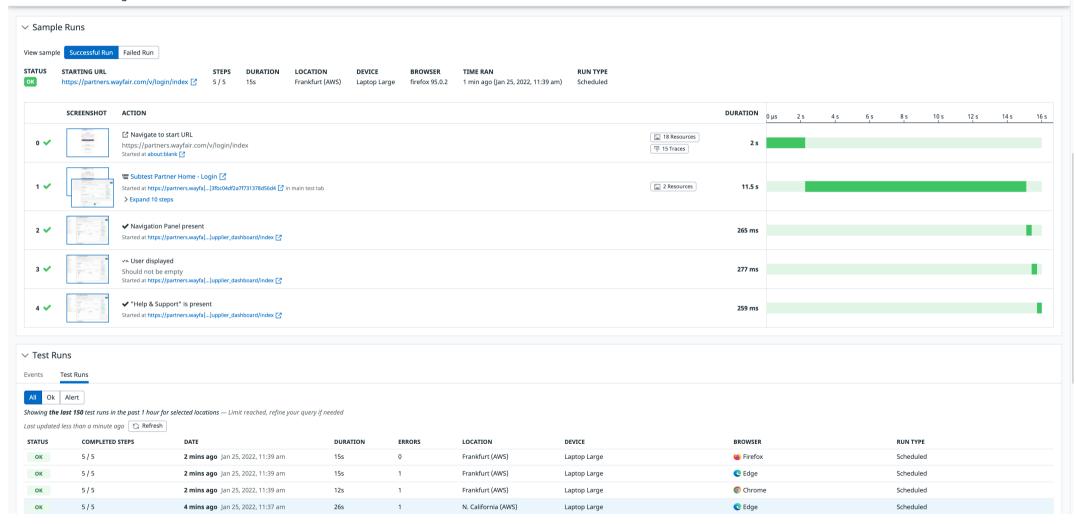

Contract Testing

matthias-kainer.de/blog/posts/contract-testing-in-the-frontend/

Monitoring

A MICRO FRONTEND IS A LIVE APPLICATION

Partner Home - Navigation Available

Scaling Usage

Remote Component

LazyModule

Webpack Configuration Shared Provider

What if you have multiple remote applications?

```
const RemoteContainerProvider = ({
  environment,
  origins,
  children,
}: RemoteContainerProviderProps) => {
  const remoteContainerRegistry = useRemoteContainerRegistry({
    environment,
    origins,
  });
  return (
    <RemoteContainerContext.Provider value={remoteContainerRegistry}>
      {children}
    </RemoteContainerContext.Provider>
  );
```

Encouraging Adoption

Should we build our new application as a micro frontend?

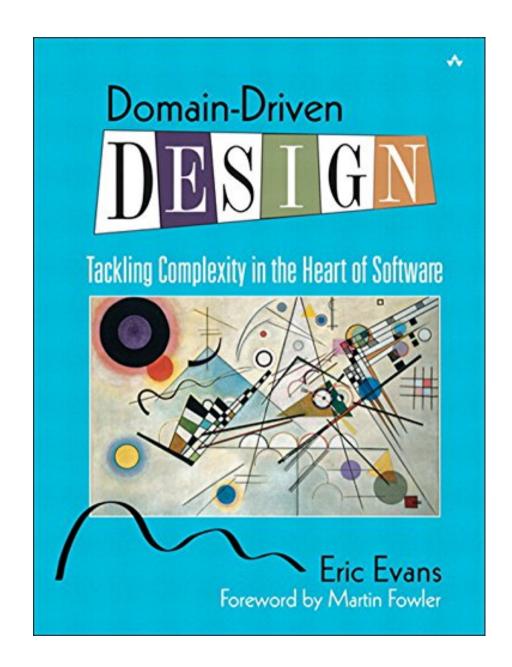

It depends!

YOU WERE SO BUSY WONDERING IF YOU COULD DO IT

YOU NEVER STOPPED TO ASK IF YOU SHOULD.

memegenerator

Micro frontends are not about technology, they are about organizational structure

Finding meaningful boundaries is hard!

Lessons Learned

Clear advantages Isolation Quick path to production

There are challenges as well!

дэн @dan_abramov

I don't understand micro-frontends.
